SUMMARY

Senior full-stack engineer building the parts of a product where **money moves and customers are watching**—**checkout, payments, invoicing**, and the **customer-facing app** people use every day—owned **end to end**, from data model and API to the screen. Deep **TypeScript** across the stack, with **sole ownership** of Sazmining's customer dashboard, plus a production commerce cutover and revenue ledgers. Ships daily with **Claude Code and Cursor agents under self-authored review rules** (review bot, local smoke test, explainer before merge); cares about products that own the whole customer experience.

SKILLS

- **Languages:** TypeScript, JavaScript, SQL, HTML5, CSS
- **Backend & data:** Node.js, NestJS, Express, Deno, Medusa (v1/v2), PostgreSQL, Redis, REST APIs / PostgREST, event-driven architecture, distributed systems, payment-provider integrations (hosted checkout, webhooks)
- **Frontend:** React, Vite, Tailwind, TanStack Query / Router / Start, Chart.js
- **AI & tooling:** Claude Code, Cursor, agentic development workflows
- **Infrastructure:** Bun, Docker, GitHub Actions, CI/CD, Fly.io, Supabase, Sentry

EXPERIENCE

Sazmining 2024 – Present · Remote

Senior Full Stack Software Engineer

- **Sole owner** of Sazmining's **customer dashboard**—the primary customer-facing product—responsible end to end for the React/TypeScript experience customers use to manage their hosted hardware service, including ongoing feature delivery, reliability, and full-stack integration with backend systems.
- Led the full-stack rebuild and production cutover of the **customer commerce platform** from Medusa v1 to Medusa v2, taking it from initial scaffolding to production across backend, storefront, and shared contracts in a monorepo—redesigning multi-facility catalog/pricing, cart and checkout, payment-provider integrations (hosted checkout, webhooks; webhook-driven settlement with amount parity and idempotent capture), QuickBooks invoicing, and inventory availability while preserving **money-correct** purchase flows.
- Launched a **customer-facing loyalty program** end to end, built to the designer's approved screens and shipped behind feature flags with a launch runbook and a scheduled go-live.
- Split a monolithic codebase into purpose-built applications: created the Admin app and a QuickBooks accounting microservice, and became the **sole backend engineer** on the shared Supabase platform behind them, including an automated service-fee billing pipeline on Supabase Edge Functions—usage-based amount calculation, Redis enqueue/process workers, and auto-charge or payment-link collection linked to QuickBooks invoices. Later hardened checkout and billing: closed checkout pricing and data-exposure issues from a **bug-bounty program** and made invoicing **idempotent** with retry and deadline handling so a re-run can't double-invoice.
- Wrote the **revenue ledger** that polls two payout providers on a schedule into insert-only records, eliminating manual reconciliation and giving leadership up-to-date financial visibility.
- Built an earnings integration with a third-party payout provider, giving hundreds of users real-time earnings transparency and provider-direct payouts; TypeScript, Supabase, and React.
- Designed a **deferred payout-destination and configuration change** system that abstracts third-party provider constraints (unsettled earnings, change windows, rate limits), so users initiate changes immediately while a background poller executes when conditions allow, with clear progress visibility.
- Built the original **Redis-based queue and cron scheduler** that dispatched hardware configuration commands across multiple data centers, pacing changes on a one-minute interval to prevent power fluctuations; continued developing its Postgres-based successor and built the deferred change queue that feeds it.
- Designed an AI-first engineering knowledge base mapping the stack, architectural decisions, and second-order change consequences, enabling AI-assisted development across a complex production codebase.
- Joined as an early hire and was the company's **sole engineer into 2025**, then led the core platform, authoring over 80% of backend code, as Sazmining scaled 350% from 2 to 5 data centers.

JAN3 2024 · Remote

Web Developer (Contract)

- Developed backend API endpoints in a NestJS and TypeScript service, including real-time content translation, powering data flows for the JAN3 and AQUA fintech product marketing websites.
- Built dynamic financial data visualizations with Chart.js and JSON APIs for complex financial datasets.

TrueSense Marketing 2022 – 2024 · Remote

Web Developer II · One & All Agency through acquisition

- Led the technical transition of 30+ clients during an agency acquisition, supporting $10M in revenue continuity through data and systems migration.
- Mentored junior developers and led code reviews, improving team practices and code quality.
- Partnered with strategists, designers, and executives to architect a mobile app, and owned engagement and donation analytics across 30+ client accounts.

Freelance 2020 – 2022 · Remote

Full Stack Engineer

- Built 20+ websites and web applications for 8 clients using React, Redux, TypeScript, Express, and NestJS, and set up CI/CD pipelines for rapid deployment.

CERTIFICATIONS

- Claude Code in Action & Claude 101, Anthropic Academy (Mar–Apr 2026)
